## Abstract:

In this paper we present the numerical solution of the Volterra Integral Equations by using the analytic method ( Adomian Decomposition Method). To demonstrate the exactness and efficacy of the proposed method (ADM), some numerical examples have been performed. A Volterra integral equation is solved by ADM which gives us the comparatively accurate solution of the problem that tends to the exact solution of the problem.

**Keywords:** Adomian Decomposition Method, Integral Equations, volterra Integral Equations, Numerical Example. Adomian Decomposition Method

## ADOMIAN DECOMPOSITION METHOD

The Adomian Decomposition method (ADM) is very powerful technique which considers the in exact solution of a nonlinear equation as an infinite series which essentially converges to the exact solution in this paper, ADM is proposed to solve some first order, second order and third order differential equations and integral equations. The Adomian Decomposition method (ADM) was firstly introduced by George Adomain in 1981. This method has been applied to solve differential equations and integral equations of linear and nonlinear problem in Mathematics, Physics, Biology and Chemistry up to know a large number of research paper have been published to show the possibility of the decomposition method.

## PROPOSED METHOD FOR SOLVING THE VOLTERRA INTEGRAL EQUATION.

The type of integral equation in which the restrictions of the integration are constant, in which  $a$  and  $b$  are constant are called the Fredholm Integral equations, and is given as

$$\phi(x) = f(x) + \rho \int_0^x K(x, t)\phi(t)dt \quad (1)$$

Where the function and the kernel are given in the advance, and  $\rho$  is a parameter. In this division, the procedure of the Adomian decomposition method is used. The Adomian decomposition method connecting the decomposing of the unknown function  $\phi(x)$  of any equation into a addition of an infinite number of constituents defined by the decomposition series

$$\phi(x) = \sum_{n=0}^{\infty} \phi_n(x) \quad (2)$$

Or In the same way

$$\phi(x) = \phi_1(x) + \phi_2(x) + \phi_3(x) \pm \dots$$

When the constituents  $\phi_n(x), n \geq 0$  will be resolved.

The Adomain decomposition method analyze itself which discover the components  $\phi_0(x), \phi_1(x), \phi_2(x) \dots$

To classify the recurrence relation , we substitute (2) into the Volterra integral equation (1) to get

$$\sum_{n=0}^{\infty} \phi_n(x) = f(x) + \int_0^x K(x,t) \sum_{n=0}^{\infty} \phi_n(t) dt \tag{3}$$

The zeroth component  $\phi_0(x)$  is spotted by all terms that are not comprises under the integral sign. This signifies that the components  $\phi_n(x), n \geq 0$  of the unknown function  $\phi(x)$  are totally resolved by the recurrence relation.

$$\phi_0(x) = f(x), \phi_{n+1}(x) = \int_0^x K(x,t) \sum_{n=0}^{\infty} \phi_n(t) dt, n \geq 0$$

Or correspondingly

Thus the solution of the Volterra integral equation (1) is easily acquired in a series form by make use of the series as assumption in (2)

### APPLICATIONS OF VOLTERRA INTEGRAL EQUATIONS:

Consider the linear volterra integral equation

$$1. \Phi(x) = x + \int_0^x (t-x)\Phi(x) dt$$

$$\Phi_0(x) = x$$

$$\Phi_1(x) = \int_0^x k(x,t)\phi_0(t) dt$$

$$= \int_0^x (t-x)t dt$$

$$= \int_0^x (t^2 - xt) dt$$

$$= \left( \frac{t^3}{3} - x \frac{t^2}{2} \right)_0^x$$

$$= \left( \frac{x^3}{3} - \frac{x^3}{2} \right) = \frac{-x^3}{6}$$

$$\therefore \Phi_1(x) = \frac{-x^3}{6}$$

$$\begin{aligned} \Phi_2(x) &= \int_0^x (t-x) \frac{-t^3}{6} dt \\ &= -\frac{1}{6} \int_0^x (t^4 - xt^3) dt \\ &= -\frac{1}{6} \left( \frac{t^5}{5} - x \frac{t^4}{4} \right)_0^x \\ &= -\frac{1}{6} \left( \frac{x^5}{5} - \frac{x^5}{4} \right) \\ &= -\frac{1}{6} \left( \frac{-x^5}{20} \right) \\ &= \frac{x^5}{120} \end{aligned}$$

$$\therefore \Phi_2(x) = \frac{x^5}{120}$$

$$\therefore \Phi(x) = \Phi_0(x) + \Phi_1(x) + \Phi_2(x) + \dots$$

$$= x - \frac{x^3}{6} + \frac{x^5}{120} - \dots$$

$$= x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots$$

$$\Phi(x) = \sin x$$

2. Consider the volterra integral equation

$$\Phi(x) = e^x + \int_0^x e^{x-t} \Phi(t) dt$$

$$\Phi_0(x) = e^x$$

$$\Phi_1(x) = \int_0^x k(x,t) \Phi_0(t) dt$$

$$= \int_0^x e^{x-t} e^t dt$$

$$= \int_0^x e^x dt$$

$$= e^x (t)_0^x = x e^x$$

$$\therefore \Phi_1(x) = x e^x$$

$$\Phi_2(x) = \int_0^x k(x,t) \Phi_1(t) dt$$

$$= \int_0^x e^{x-t} t e^t dt$$

$$= \int_0^x t e^x dt$$

$$= e^x \left( \frac{t^2}{2} \right)_0^x = \frac{x^2}{2} e^x$$

$$\therefore \Phi_2(x) = \frac{x^2}{2} e^x$$

$$\Phi_3(x) = \int_0^x k(x,t) \Phi_2(t) dt$$

$$= \int_0^x e^{x-t} \frac{t^2}{2} e^t dt$$

$$= \int_0^x e^x \frac{t^2}{2} dt$$

$$= \frac{e^x}{2} \left( \frac{t^3}{3} \right)_0^x = \frac{x^3}{6} e^x$$

$$\therefore \Phi_3(x) = \frac{x^3}{6} e^x$$

$$\therefore \Phi(x) = \Phi_0(x) + \Phi_1(x) + \Phi_2(x) + \dots$$

$$= e^x + x e^x + \frac{x^2}{2} e^x + \frac{x^3}{6} e^x + \dots$$

$$= e^x \left[ 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \dots \dots \right]$$

$$= e^x \cdot e^x = e^{2x}$$

3. Consider the volterra integral equation

$$\Phi(x) = e^x - \int_0^x e^{x-t} \Phi(t) dt$$

$$\Phi_0(x) = e^x$$

$$\Phi_1(x) = \int_0^x k(x,t) \Phi_0(t) dt$$

$$= \int_0^x -e^{x-t} e^t dt$$

$$= - \int_0^x e^x dt$$

$$= - e^x (t)_0^x = - x e^x$$

$$\therefore \Phi_1(x) = - x e^x$$

$$\Phi_2(x) = \int_0^x k(x,t) \Phi_1(t) dt$$

$$= \int_0^x -e^{x-t} (-t e^t) dt$$

$$= \int_0^x t e^x dt$$

$$= e^x \left( \frac{t^2}{2} \right)_0^x = \frac{x^2}{2} e^x$$

$$\therefore \Phi_2(x) = \frac{x^2}{2} e^x$$

$$\Phi_3(x) = \int_0^x k(x,t) \Phi_2(t) dt$$

$$= \int_0^x -e^{x-t} \frac{t^2}{2} e^t dt$$

$$= \int_0^x -e^x \frac{t^2}{2} dt$$

$$= - \frac{e^x}{2} \left( \frac{t^3}{3} \right)_0^x = - \frac{x^3}{6} e^x$$

$$\therefore \Phi_3(x) = - \frac{x^3}{6} e^x$$

$$\therefore \Phi(x) = \Phi_0(x) + \Phi_1(x) + \Phi_2(x) + \dots \dots \dots$$

$$= e^x - x e^x + \frac{x^2}{2} e^x - \frac{x^3}{6} e^x + \dots \dots \dots$$

$$= e^x \left[ 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \dots \dots \dots \right]$$

$$= e^x \cdot e^{-x} = 1$$

**Conclusion:**

The aim of this paper is to employ the Adomain Decomposition Method for solving the Volterra Integral Equation . It can be visibly seen that decomposition method for the Volterra Integral Equation is equivalent to consecutive approximation method. Even though the Adomain decomposition method is very burly and useful tool for solving the integral equations.
