# Effects of Environmental Conditions on Development of Intelligence of College Students in The Districts of Kolkata and North \& South 24 Parganas, West Bengal 

Debasish Sarkar ${ }^{1}$, Dr. Sunil Kumar Baskey ${ }^{2}$<br>${ }^{1}$ Assistant Teacher, Ankurhati Kibria Gazi School (H.S.)<br>${ }^{2}$ Assistant Professor, Department of Education, Rabindra Bharati University, 56A, B.T. Road, Kolkata700050

#### Abstract

: Various environmental factors like place of birth, family income, physical exercise, parent's occupation and education influence the intelligent quotient of student to a great extent. Genes play a pivotal role in determining intelligence. The genes contribute bout $20-40 \%$ of the variance in intelligence in childhood and about $80 \%$ in the adulthood. Gene and its interaction with environment have created the variation in intelligence in groups of young children. Environment and intelligence are correlated with each other and environment has great impact on different levels of intelligence. Here the researcher search that how environmental condition and intelligence are correlated with different age, sex, cast, locate. The investigator wants to know the effect of environmental conditions on the growth of intelligence of student. This paper deals with how environmental condition closely is related with intelligence.

Key words: Environment conditions, Intelligence, College students

Introduction: Development of intelligence is affected by various environmental influences like family, peer-group, training and intervention environmental environment. Intelligence cannot be changed with changed timeline. Love affection, concern, generosity bestowed on growing of student Childhood to adulthood. Poor environments related and retorted development of intelligence. A student's IQ is influenced by genetic and environmental factors. The major characteristics of intelligence are ability to learn, solved problem, think abstractly, comprehending complex ideas and learn.

The environmental factors influence typically the intelligence of children which is termed $s$ general intellectual climate of the home. According to psychologists parental encouragement and involvement for achievement, responsiveness of parent's to the child's overtures, stimulating lays and Books, intellectual activities of parents all are together called 'between family environmental factors'. Between family environmental factors are influential but the environmental conditions that contribute to the mental performance of the students (Freeberg \& Pyne, 1967; McCall, 1979). Rows and Plomin (1981) have emphasized that the between family factors may be great influence on the development of intelligence. They suggest half the variance of general mental performance is an environmental and half of that environmental variation is within the family and not shared by sibling. Biometric students of adult twines used to estimates of genetic and environmental influence on intelligence and special mental abilities. Sir Francis Galton observed the relationship between biological families confounded genetic and environmental determinants of human traits. Galton introduces the use of both twins and adoptees for a method to detachment two sources of influence (Galton 1876, 1883). He also invented the method of correlation (Galton 1888; Stigler 1989), variants of which underlie most twin research (Neale and Cardon 1992) Galton is the pioneer and founder of quantitative behavioural genetics.

## Review of Related Literature:

In Galton's period, both our understanding of the nature of human mental abilities and methods for detaching the various genetic and environmental sources of variance in these abilities (Bouchard Jr . J.T.; 1998) Genetic influences are the main drawing force behind continuity in general cognitive ability. Unique environmental influences contribute to the change of cognitive abilities solely (Bartels N.; Rietveld H.J.N., Ball V.N.C.G. et. al). Development of intelligence is affected by various environmental influences like family, peer group, education, training and intervention environmental enrichment and biological influences like nutrition, stress, mental age, perinatal factors, exposure to toxic chemicals and other substances also effects intelligence and development of genius (Nagpal J., Arora K.V. Nagpl B.; 2015). A longitudinal study that reveal that intra individual variation average in IQ accounts for as such or more variability that has been estimated to be the non-shared within environmental variation in IQ (McCall B.R.; 1983). Students should set detailed short term goals to easily achieve long term goals. Soft skill élans like self identification skills, goal setting skills, time management skills help to student's their own strengths and weakness and able to set suitable goals and achieve that goal effectively, those skills classes help students learn how to solve problem in life and learning (NGUYEN T.K., DOUNG M.T. et. 1 2019). Individual differs in intelligence due to difference in their environment (Makharia A., Nogranjn A., Mishra A. Et. al., 2016).

## Objectives of the Study:

1. To find out any difference between the distribution of intelligence between government and non government schools in the same environment.
2. To find out any difference between the distribution of intelligence boys and girls students in the same environment.
3. Two find out any difference between distribution of intelligence between urban and rural students in the same environment.
4. Two find out any difference between distribution of intelligence between general and schedule caste students in the same environment.

## Hypothesis:

$\mathbf{H}_{01}$ : There is no effect of environmental conditions on the distribution of intelligence between government and non government college level.
$\mathbf{H}_{02}$ : There is no effect of environmental conditions on the distribution of intelligence between Boys and girls student college level.
H03: There is no effect of environmental conditions on the distribution of intelligence between urban and rural students at college level.
$\mathbf{H}_{04}$ : There is no effect of environmental conditions on the distribution of intelligence between general and scheduled caste students at college level.

## Methodology:

Present study conducted by primary and secondary data, place of residence, physical activity, family income, parental education, occupation of father. This study was quantitative in nature and descriptive survey approach was applied for conducting research.

## Variables:

Intelligence question considered as a variable and environmental condition considered as an independent variable.

## Sample:

The sample of 600 students in different colleges at Kolkata district and its fringe district North 24 Parganas and South 24 Parganas was conducted as a sample and simple random sampling was used to data collection.

## Tools:

A questionnaire was developed on environmental factor influence intelligence with 60 items ( 30 positive and 30 negative). This test item was based on five point likert scales. This reliability of the tool was established using split-half method, content and construct validity has been established by the researcher. .Weschlet's IQ test for calculation of IQ has been used. Cross sectional observational study for 500 college student the age $19-23$ from 10 government college, 15 private college, 5 villages, 5 cities statistical techniques, percentage, SD ' $t$ ' test of the data was used to research purpose.

## Delimitation of the Study:

The study was confine to college level student because their more sincere, young and sophisticated and attentive to their course and curriculum are than children. This study was confined to Kolkata District, North 24 Parganas, and South 24 Parganase because the admission procedures of college are arranged to their merit and they are attracted by good academic calendar of the college in mentioned district.

## Data Analysis and interpretation:

(a) Descriptive Statistics:

| Variable | IQ |  |  | TOTAL | P Value |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  | Dull Average | Average | Bright Average |  |  |
| Urban | $240(65.21)$ | $80(21.7)$ | $48(13.04)$ | $368(61.33)$ |  |

IQ of age $23=\frac{68}{56} \times 100=121.4$

Interpretation $=$ All student comes under average and bright average category.

## (b) Inferential Statistics

(a) Comparison between Government and Non-government College.

Step - I: Setting up null hypothesis $\mathrm{H}_{0}$
$\mathrm{H}_{0}$ : There is no difference between the distributions of intelligence in both the groups, in other word; groups do not differ in terms of distribution of intelligence.

Step - II : Computation of rank order between government school and non government school.

| Score | Rank | Score | Rank |  |
| :---: | :---: | :---: | :---: | :---: |
| 121 | 25 | 116 | 17.5 | Step - III : Total of Rank |
| 98 | 04 | 99 | 05 | $\mathrm{R}_{1}+\mathrm{R}_{2}=235.5+115.5=351$ |
| 109 | 12 | 112 | 15.5 | $\underline{\mathrm{N}(\mathrm{N}+1)}$ |
| 104 | 07 | 110 | 13.5 | 2 |
| 116 | 17.5 | 97 | 03 | Here $\mathrm{N}=\mathrm{N}_{1}+\mathrm{N}_{2}=16+10=26$ |
| 118 | 21.5 | 119 | 23 | Therefore Total $=\underline{26 \times 27}=351$ |
| 120 | 24 | 94 | 02 | Step IV : |
| 117 | 19.5 | 118 | 21.5 | $\mathrm{U}=\mathrm{N}_{1} \mathrm{~N}_{2}+{\underline{\mathrm{N}} 11\left(\mathrm{~N}_{1}+1\right)}^{(1)} \mathrm{R}_{1}$ |
| 106 | 09 | 94 | 02 | 2 |
| 125 | 26 | 90 | 01 | $\mathrm{U}^{\prime}=\mathrm{N}_{1} \mathrm{~N}_{2}+\underline{\mathrm{N} 2\left(\mathrm{~N}_{2}+1\right)}-\mathrm{R}_{2}$ |
| 108 | 10.5 | $\mathrm{R}_{2}=115.5$ |  | $\mathrm{U}=16 \times 10+\underline{2} \underline{16(16+1)}-235.5$ |
| 105 | 08 |  |  |  |
| 108 | 10.5 |  |  | 2 |
| 112 | 15.5 |  |  | $\begin{aligned} &=160+136-235.5 \\ &=160+136-235.5 \\ &=296+235.5-60.5 \\ & \mathrm{U}+\mathrm{U}^{\prime} \mathrm{N}_{1} \times \mathrm{N}_{2} \text { or } \mathrm{U}^{\prime}=\mathrm{N}_{1} \times \mathrm{N}_{2}-\mathrm{U} \\ & 60.5=16 \times 10-\mathrm{U}^{\prime} \end{aligned} \begin{aligned} \mathrm{U} & =160-60.5=99.5 \\ \mathrm{U} & =160 \times 10+\underline{10(10+1)}-115.5 \\ & =160+55+-115.5 \\ & =215-115.5=99.5 \end{aligned}$ |
| 114 | 6 |  |  |  |

Step - V : In the table find $\mathrm{N}_{1}$ (larger group) i.e. 16 and $\mathrm{N}_{2}$ (smaller group $=10$ at $\ldots .0 .05$ level. The critical value of ' U ' from the table is 48 . ( t the intersection of $\mathrm{N}_{1}$ and $\mathrm{N}_{2}$. The computed smaller value of

U is 60.5. It is larger than the critical value of U i.e. 48 from the table for this significance at 0.05 level. Hence $\mathrm{H}_{0}$ is to be accepted. Thus the researcher conclude that the both the schools do not differ in terms of the distribution of intelligence on account of the environmental influence.
(b) Comparison between Urban and Rural Student:

Step 1:Setting null hypothesis
$\mathrm{H}_{0}$ : There is no difference between the distribution of intelligence in the both the urban and rural student, on these groups of student do not differ in terms of distribution of intelligence.
Level of significance $=0.05$ level.

Step - II Comparison of rank order between urban and rural college student.

$$
\begin{aligned}
U^{\prime} & =\mathrm{N}_{1} \mathrm{~N}_{2}+\frac{\mathrm{N}_{2}\left(\mathrm{~N}_{2}+1\right)}{2}-\mathrm{R}_{2} \\
& =10 \times 15+\frac{15(15+1)}{2}-218 \\
& =150+\frac{15 \times 16}{2}-218 \\
& =150+\underline{240}-218
\end{aligned}
$$

International Journal for Multidisciplinary Research (IJFMR)
E-ISSN: 2582-2160 • Website: www.iffmr.com • Email: editor@ijfmr.com

$$
=150+120-218
$$

$$
=270-218
$$

$$
=52
$$

Actually $\mathrm{U}+\mathrm{U}^{\prime}=\mathrm{N}_{1} \mathrm{~N}_{2}$ or $\mathrm{U}^{\prime}=\mathrm{N}_{1} \mathrm{~N}_{2}-\mathrm{U}$

$$
\begin{aligned}
52 & =10 \times 15-\mathrm{U} \ldots \\
\text { or } \mathrm{U} & =150-\mathrm{U} \\
& =150-92 .
\end{aligned}
$$

find $\mathrm{N}_{1}=10$ (Smaller group) and $\mathrm{N}_{2}$ (larger group) at the 0.05 level the critical value of U from table is 44. The computed value is 57.5 . It is larger than critical value of $U$ i.e. 44 read from the table for the significance level. Thus we may conclude that both the groups do not differ in terms of the distribution of intelligence on account of the environmental differences.
(c) Comparison between Boys and Girls student at college level :-

Step - I Setting up of null hypothesis $\mathrm{H}_{0}$
$\mathrm{H}_{0}$ : There is no difference between the distribution of intelligence in both boys and girls. In other hand the groups do not differ in terms of distribution of intelligence

Step - II Computation of Table of Rank $\mathrm{R}_{1}$ and $\mathrm{R}_{2}$
(d) Comparison of rank order Boys and Girls student.

| Boys Student |  | Girls Student |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Score | Rank | Score | Rank |  |
| 57 | 115 | 68 | 25 | $\begin{aligned} & \mathrm{R}_{1}+\mathrm{R}_{2}=250.5+170.5=421 \\ & \underline{\mathrm{~N}(\mathrm{~N}+1)} \end{aligned}$ |
| 60 | 16.5 | 64 | 23.5 |  |
| 62 | 19.5 | 65 | 25 | 2 |
| 56 | 9.5 | 66 | 19.5 | Here $\mathrm{N}=\mathrm{N}_{1}+\mathrm{N}_{2}=21+10=31$ |
| 58 | 13.5 | 62 | 16.5 | Therefore Total $=\underline{31 \times 32}=496$ |
| 54 | 5.5 | 60 | 13.5 | 2 |
| 56 | 9.5 | 58 | 21.5 | Step IV : = |
| 64 | 23.5 | 63 | 21.5 |  |
| 52 | 2.5 | 63 | 43 | $\mathrm{U}=\mathrm{N}_{1} \mathrm{~N}_{2}+\underline{\mathrm{N}}_{1}\left(\mathrm{~N}_{1}+1\right)-\mathrm{R}_{1}$ |

The computed value of $\mathrm{Z} \equiv>1.96$ is considered not significant at 0.05 level of significance for two tailed test.) and hence $\mathrm{H}_{0}$ is accepted. For one tailed test -Z value $\geq 1.64$ at 0.05 -and reject the alternative hypothesis

It is significant at 0.05 level because computed value of $\mathrm{Z}>1.96$. So $\mathrm{H}_{0}$ stand rejected so. There can be difference in intelligence between boys and girl. So, environmental condition effects the growth of intelligence.
(d) Comparison between general caste and scheduled cast students in college.
$\mathrm{H}_{0}$ - There is no difference between the distribution of intelligence in both general and scheduled caste student, these group of student do not differ in terms of distribution of intelligence :

Level of significance at 0.05 level.

$$

The computed value $Z \geq$ is consider not significant at 0.05 level of significance for two tailed test and hence 80 stand accepted. For one tailed test the Z value $\geq 1.64$ at 0.05 level reject the alternative hypothesis.

It is significant at 0.05 level because computed value of $\mathrm{Z} \geq 1.96$ so $\mathrm{H}_{0}$ Stand rejected. Therefore there can be difference in intelligence between general caste and schedule caste students. Here, environmental conditions like caste effect the growth of intelligence.

## Discussion:

From the above data, researcher concludes according to descriptive statistics $65.2 \%$ urban students belong in dull average and $225 \%$ in rural area. Average students are maximum the both urban and rural area like $22 \%$ to $30 \%$. So, maximum students in college level belong average IQ. According to gender boys students are more dull average than girl's students in college level. Average IQ of girls (41\%) is more than boys' students. At the college level. Dull average students belong in non government college than Government College. According caste average IQ students belong the both general and schedule caste students. But bright students are same level $(10-20 \%)$ but more students belong in average IQ in both general and scheduled caste students.

## Conclusion:

From the above discussion IQ is a significant factor which is influence of environmental condition like local, gender college status, caste etc. Another important environment factors related with IQ are family with income, peer group, education, training and intervention, environmental enrichment, security students, child safety thinking of living house, living security, missing college class, water, quality, softy food etc.
