## ABSTRACT:

**Background:** Family planning methods is an approach to avoid unplanned pregnancies, promote small family and to regulate the birth spacing. Therefore, adopting family planning methods is essential for managing population size.

**Aim:** To assess the attitude and practice of family planning methods among women in selected rural areas, Sonitpur, Assam.

**Methodology:** A total 208 samples were selected by multistage sampling technique by using interview methods with the help of self-structure questionnaire.

**Results:** Results showed that majority of women 116 (55.77%) subjects had Moderately favorable attitude followed by 48(23.08%) had Unfavorable attitude and 44(21.15%) had Favorable attitude regarding family planning methods with an average mean score 34.02 and SD 6.02 and also majority 86 (41.35%) subjects had poor practice followed by 83 (39.90%) had average practice and 39 (16.35%) had good practice with an average mean score 5.62 and SD 5.10. There is a significant association between attitude of family planning methods among women with the education, occupation, types of family, monthly family income, no. of child, previous knowledge regarding family planning methods, source of information, duration of marriage, size of family at 0.05 level of significant. There is moderately positive correlation between attitude and practice among the women.

**Conclusion:** Study concluded that despite women's neutral attitude toward family planning technologies, their contraceptive behavior is poor. Women's understanding of family planning methods is often clouded by misconception such as IUCD can perforate the uterus, children are gifts of God.

**Keywords:** Attitude, Practice, Women, Family Planning methods

## INTRODUCTION:

Family planning methods is an approach to avoid unplanned pregnancies, promote small family and to regulate the birth spacing.<sup>1</sup> Due to declining death rate, increased birth rate, early marriage, lack of education, poverty, religious believes, poor practice of family planning methods population is increased day by dy. Therefore, adopting family planning methods is essential for managing population size and promoting economic stability. With a population of 1.428 billion, India now makes up 17.8% of the world's 8.091 billion inhabitants (2023 estimations), up from 17.70% in the 2011 census when its

population was estimated to be 1.21 billion.<sup>2</sup> In 2023, Northeast accounted for 17% of India's total population. Assam has 35,824,00 lakh population. As per 2011 census report, the population of Sonitpur district is 1,924,110. It is the 3<sup>rd</sup> most populous district of Assam, after Nagaon and Dhubri district. Now population of Sonitpur district in 2023 is 2,674,513 (estimates as per aadhar uidai.gov.in Dec2023 data).<sup>3</sup> According to 2011 census, total fertility rate in Sonitpur district is 2.7 also maternal death of Sonitpur district in 2021-22 FY is 29 (as per SSD report NHM).<sup>4</sup>

Being a mother is the pinnacle of womanhood. But not every pregnancy is planned.<sup>5</sup> Every pregnant woman runs the risk of unexpected, unexpected complications that could cause her or her unborn child to die or suffer serious injuries. Family planning interferes with a woman's reproductive cycle and assists her manage the frequency, duration, and spacing of her pregnancies, reducing maternal death and disease and improving a woman's health.<sup>6</sup> Now a days even with adequate knowledge, certain misconception, religious beliefs and myths can lead to negative attitude towards family planning methods. Urgent action is required to stabilize population growth, reduce maternal mortality and lower total fertility rates ensuring a healthier, more sustainable future. Therefore, it is essential to assess attitude and practice of family planning methods among women.

#### **STATEMENT OF THE PROBLEM:**

Attitude and Practice of Family Planning Methods among Women in selected Rural Areas, Sonitpur, Assam.

#### **OBJECTIVES:**

- a) To assess the attitude towards family planning methods among women in selected rural areas, Sonitpur, Assam.
- b) To assess the practice of family planning methods among women in selected rural areas, Sonitpur, Assam.
- c) To find out the association between attitude towards family planning methods among women with selected socio-demographic variables in selected rural areas, Sonitpur, Assam.
- d) To find out the association between practice of family planning methods among women with selected socio-demographic variables in selected rural areas, Sonitpur, Assam.
- e) To find out the correlation between attitude and practice of family planning methods among women in selected rural areas, Sonitpur, Assam.

#### **HYPOTHESES:**

**H1-** There is a significant association between attitude towards family planning methods among women and selected socio-demographic variables in selected rural areas, Sonitpur, Assam.

**H2-** There is a significant association between practice of family planning methods among women and selected socio-demographic variables in selected rural areas, Sonitpur, Assam.

**H3-** There is a significant correlation between attitude and practice of family planning methods among women in selected rural areas, Sonitpur, Assam.

#### **MATERIALS AND METHODS:**

A quantitative cross-sectional research design was adopted to assess attitude and practice of family planning methods among women in selected rural areas of Sonitpur district, Assam. 208 women were

selected using multistage sampling technique and data were collected by interview method through self-structured questionnaire. The analysis was done by using descriptive and inferential statistics in terms of frequency, percentage, mean, median, mode, standard deviation and chi-square test.

## RESULTS:

### Section 1: Finding related to Socio- Demographic Data

**Table 1: Frequency and percentage distribution of women according to selected socio-demographic variables**

**n=208**

Demographic variables	Frequency (f)	Percentage (%)
<b>Age of the women</b>		
18-25 years	69	33.17
26-33 years	91	43.75
38-41 years	39	18.75
42-49 years	9	4.33
<b>Education</b>		
No formal education	16	7.69
Can read and write	4	1.92
Primary school	21	10.09
Middle school	83	39.90

<b>Age at marriage</b>		
18-28years	197	94.71
29-39 years	11	5.29
<b>Age of husband</b>		
21-30 years	54	25.96
31-40years	104	50
41-50 years	41	19.71
>60 years	9	4.32
<b>Duration of marriage</b>		
<1year	14	6.73
1-3 years	31	14.90
3-5 years	22	10.58
>5 years	141	67.79
<b>Size of the family</b>		
>5 no.	81	38.94
<5 no.	127	61.06
<b>Age of the last child (in years)(n=174)</b>		
<1year	34	19.65
1-3 year	48	24.86
>3 year	97	55.74

Table 1 shows the frequency and percentage distribution of selected socio-demographic variables among women. The study showed that majority of women i.e., 91 (43.75%) belongs to age group 26-33 years, 83(39.90%) are middle school passed, 189 (90.86%) are belongs to Hinduism, 183 (87.98%) are home maker, 127 (61.05%) have nuclear family, 98(47.11%) have 9232-27684 rupees monthly income, 87

(41.82%) have one child, 158 (75.96%) have previous knowledge regarding family planning methods, 122 (77.21%) get information regarding family planning methods from health worker, 197 (94.71%) women married at the age of 18-28 years, 104 (50%) husband belongs to 31-40 years of age, 141 (67.79%) have more than 5 years of marriage, 127 (61.06%) have less than 5 numbers of family member in their family, 97 (55.74%) have their last child belongs to more than 3 years of age.

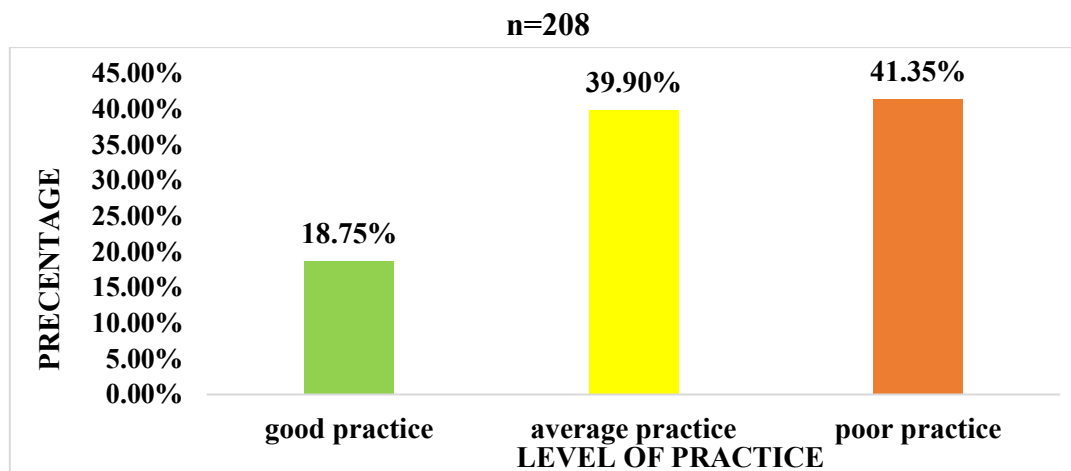

## Section-2: Frequency and percentage distribution of women on the basis of attitude of family planning methods

**Fig 1: Bar diagram representing percentage distribution of women on the basis of attitude of family planning methods**

Data on figure 1 depicts the percentage distribution of attitude on family planning methods among women. Results revealed that majority 116 (55.77%) subjects had Moderately favorable attitude followed by 48(23.08%) had Unfavorable attitude and 44(21.15%) had Favorable attitude.

## Section 3- Frequency and percentage distribution of women on the basis of practice of family planning methods

**Fig 2: bar diagram representing percentage distribution of women on the basis of practice of family planning methods**

Data on fig.2 depicts the frequency and percentage distribution of practice on family planning methods among women. Results revealed those 86 (41.35%) subjects had poor practice followed by 83 (39.90%) had average practice and 39 (16.35%) had good practice.

## Section 4: association between attitude towards family planning methods among women with selected socio-demographic variables

NS-non-significant

Data presented on the table 2 shows that there is a statistically significant association between attitude of family planning methods among women with the education, occupation, types of family, monthly family income, no. of child, previous knowledge regarding family planning methods, source of information, duration of marriage, size of family at 0.05 level of significant. Therefore, research hypothesis H<sub>1</sub> was accepted.

## Section 5: Association between practice of family planning methods among women with selected socio-demographic variables

\*p <0.05 level of significance

\*\* strongly significant

NS-non-significant

Data presented on the table 3 shows that there is a statistically significant association between practice of family planning methods among women with selected socio-demographic variables is accepted in regards to no. of child, previous knowledge regarding family planning methods, source of information, duration of marriage at 0.05 level of significant. Therefore, research hypothesis H<sub>2</sub> was accepted.

## Section 5: Correlation between attitude and practice about family planning methods among women n=208

**Fig 3: Scatter diagram representing moderately positive correlation between attitude and practice about family planning methods.**

Fig 3 depicts that “r” value is 0.71, p value is <0.00001, which is significant at 0.05 level of significance. The r value 0.71 confirm that there is moderately positive correlation between attitude and practice among the women. Hence, the research hypothesis ( $H_3$ ) stating there is a significant correlation between attitude and practice of family planning methods among women is accepted.

### RECOMMENDATIONS:

On the basis of this present study, the following recommendation have been made for further studies-

- A qualitative study can be designed to explore perceived barriers and elucidate the factors driving poor practice of contraception.
- A similar study can be planned with addition of partner’s (husband) contribution in family planning methods.
- A similar study can be conducted to assess the knowledge of family planning methods among women.
- A homogeneous study can be conducted with large sample size so that findings can be generalized.

### CONCLUSION:

In order to evaluate the attitudes, and practice of family planning methods in a selected rural area, Sonitpur, Assam, 208 women participated in a cross-sectional descriptive study employing a self-structured questionnaire and a multistage random sampling. The study's findings indicate that despite women's neutral attitude toward family planning technologies, their contraceptive behavior is poor. The government’s effort to diversify contraceptive options have not yet resonate with women, most of them only know about OCP, IUCD and condom. Women’s understanding of family planning methods is often

clouded by misconception such as IUCD can perforate the uterus, children are gifts of God, so there is no question of adopting family planning methods etc.
